Prime Superior

**GROW WITH PRIME SUPERIOR
DRENCH & CONCENTRATE**

PRIMESUPERIOR.COM

GROWING WITH PRIME SUPERIOR DRENCH AND CONCENTRATE

This regimen uses Prime Superior Concentrate (or Prime Superior Drench for small grows) to treat clones or seeds. This sets up a beneficial symbiosis as early as possible in the life of the plant.

This is followed by maintenance every 7 days by spraying with Prime Superior Concentrate or Prime Superior Drench. This ensures a clean and vigorous grow.

General Considerations.

Always mix the Prime Superior Concentrate well with the water/nutrients (diluted 3 ml per gallon) or shake the Prime Superior Drench before spraying.

Do not let the products reach a temperature above 90 degrees or leave them in direct sunlight.

TREATING CLONES OR SEEDS

SEEDS

1. Spray the seeds with Prime Superior Drench/Concentrate immediately after planting in either soil, rockwool or between filter paper.
2. Ensure that the seeds are wet.

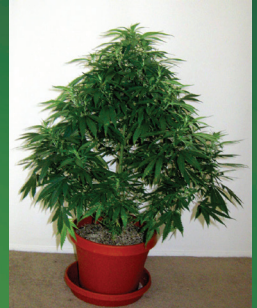

CLONES

1. Make the Clones as usual using rockwool cubes or a cloning machine.

2. Upon transfer of the rooted clones to soil, spray the soil around the roots until wet with *Prime Superior Drench/Concentrate*.
3. Upon transfer of the rooted clones to hydroponics, spray the leaves until wet with *Prime Superior Drench/Concentrate*.

MATURE/MOTHER PLANTS

1. Mature/Mother Plants can be extremely valuable and can be inoculated by spraying the leaves or soil with *Prime Superior Drench/Concentrate*.
2. For plants in soil, spray the roots and leaves with *Prime Superior Concentrate* diluted 3 ml per gallon or *Prime Superior Drench*.
3. For hydroponic plants, spray the leaves with *Prime Superior Concentrate* diluted 3 ml per gallon or *Prime Superior Drench*.

MAINTENANCE

1. Every 7 days, spray the roots and leaves with *Prime Superior Concentrate* (3 ml per gallon).
2. Spray or mist towards the end of the light period to minimize any effects of high temperature or UV light.
3. If you see any insects or diseases, immediately spray with diluted *Prime Superior Concentrate* and make sure that both the upper and lower surfaces of the leaves are wet. This ensures good symbiosis and plant growth.
